Section 1

Please answer all questions.

You could answer and copy your codes for the answers to this document and then send the file back to reviewer.

Question 1

Assuming http://codequiz.azurewebsites.net/data returns an object {data: 10}.
Below function doesn't work correctly.

```
function thisIsSyncFunction() {
   let result = 0;

   fetch('https://codequiz.azurewebsites.net/data').then(res => res.json()).then((response) =>
{
      result = response.data;
   });
   return result;
}

const number1 = thisIsSyncFunction()
const calculation = number1 * 10;
console.log(calculation);
```

> 1.1 Please correct the code, so it really prints out the expected result (100). You can fix it anyway you like but it still has to call fetch as the source of data.

```
function thisIsSyncFunction() {
   let result = 0;

   fetch('https://codequiz.azurewebsites.net/data')
        .then(res => res.json())
        .then((response) =>   {
          let data = response.data

           return {'result': true, ...data};
        }).catch((error) => {
          return { 'result': false, 'message': error};
        });

}

console.log("Start");
var i;
```

```
    for(i = 0; i < 100; i++){
      let results = thisIsSyncFunction()
     if(results.result){
        console.log('success,  i : ',  results.data);
      }else{
        console.log('error , i : ',  results.message);
      }
    }

    console.log("End");
```

1.2 Is there a way to make **thisIsSyncFunction** really synchronous, so number1 has the value 10 before it is used for the calculation on the next line.

```
  async  function thisIsSyncFunction() {
      let result = 0;
     await  fetch('https://codequiz.azurewebsites.net/data')
           .then(res => res.json())
           .then((response) =>   {
             let data = response.data

              return {'result': true, ...data};
           }).catch((error) => {
             return { 'result': false, 'message': error};
          });

  }

  console.log("Start");
  var i;
  for(i = 0; i < 10; i++){
    let results = await thisIsSyncFunction()
   if(results.result){
      console.log('success,  i : ',  results.data);
    }else{
      console.log('error , i : ',  results.message);
    }
  }

  console.log("End");
```

Question 2

From this code https://codepen.io/domrongpon-tanpaibul/pen/ExgVrPJ
, please provide the CSS that move the start to the middle of the box.

Add class = star
.parent {
  position: relative;
  width: 200px;
  height: 100px;
  border: 2px solid black;
}
.star{
   position: absolute;
     top: 50%;
     left: 50%;
     transform: translateY(-50%) translateX(-50%)
}

Question 3

From this code, https://codepen.io/domrongpon-tanpaibul/pen/YzGyBZq?editors=1010
, please make the box <u>not close</u> when click close button. You should not modify the DOM elements in this page, but rather achieve this by handling the event.

Note that you can only add code inside Quiz block in JS section but can't modify class MyDlg.

```
/*
* Do not modify this class.
* Custom Dialog Element.
*/
class MyDlg extends HTMLElement {
  constructor() {
    super();
  }
  connectedCallback() {
    const div = document.createElement('div');
    div.id = "container";
    div.style.position = "relative";
    div.style.width = div.style.height = "100px";
    div.style.border = "1px solid black";
    const closeBtn = document.createElement('button');
    closeBtn.textContent = "X";
    closeBtn.style.position = "absolute";
    closeBtn.style.right = "0";
    closeBtn.addEventListener('click', () => {
      if (this.dispatchEvent(new CustomEvent('close-dlg', {cancelable: true}))) {
        div.style.display = "none";
      }
    })
    div.appendChild(closeBtn);
    this.appendChild(div);
  }
}

// Class Inheritance
class MyDlg2 extends MyDlg {
  connectedCallback() {
    const div = document.createElement('div');
    div.id = "container";
    div.style.position = "relative";
    div.style.width = div.style.height = "100px";
    div.style.border = "1px solid black";
    const closeBtn = document.createElement('button');
    closeBtn.textContent = "X";
    closeBtn.style.position = "absolute";
    closeBtn.style.right = "0";
    closeBtn.addEventListener('click', () => {
      console.log('Not close MyDlg')
    })
    div.appendChild(closeBtn);
```

```
    this.appendChild(div);
  }
}

// Define the new element
customElements.define('my-dlg', MyDlg2);

/* Quiz: Write code to prevent dialog to close when click close button */
const dlg = document.getElementById('dlg');

/****/
```

Question 4

From this code, https://codepen.io/domrongpon-tanpaibul/pen/zYKvboB
, please write code to show RGB code that users clicked inside the answer box. Please consider the efficiency of the code as well.

```
const getRandomRGB = () => {
  const r = Math.floor(Math.random() * Math.floor(255));
  const g = Math.floor(Math.random() * Math.floor(255));
  const b = Math.floor(Math.random() * Math.floor(255));
  return `rgb(${r},${g},${b})`;
};

const colorPicker = document.getElementById('colorPicker');

const answerBox = document.getElementById('answerBox');

for (let i=0; i<10000; ++i) {
  const btn = document.createElement('button');
  const rgb = getRandomRGB();
  btn.id = rgb;
  btn.textContent = rgb;
  btn.style.backgroundColor = rgb;

  btn.addEventListener('click', () => {
    answerBox.style.background = rgb;
  })

  colorPicker.appendChild(btn);
}
```
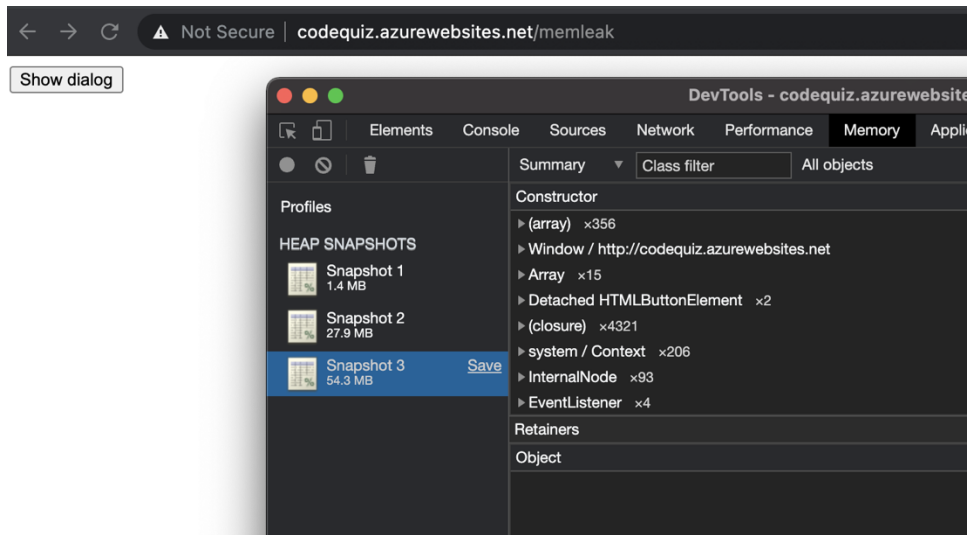

Question 5

Find the memory leak in this application http://codequiz.azurewebsites.net/memleak
When ever user open a dialog, and close it, a memory will keep increased around 25 MBs per round. Please identify what is causing the memory leak, and how to fix it and describe how you investigate it.

** Please note that the big array in the code was added intentionally, to make it easier to see the leak.
This array should be cleared by browser GC when the dialog is closed, and element is removed from DOM, but it is not (why is it the case?)

Show dialog

Answer :

Because : array

```
const tmp = [];
for(let i = 1; i < 5000000; i++) {
    tmp.push(i);
}
closeBtn.tmp = tmp;

console.log(`#1 ${Math.round((process.memoryUsage().heapUsed / 1024 / 1024) * 100)
/ 100} MB`);

if (global.gc) {
  global.gc();
}
console.log(`#2 ${Math.round((process.memoryUsage().heapUsed / 1024 / 1024) * 100)
/ 100} MB`);
```

Question 1

Please create a web application following below specs.
- Angular framework is preferred, but you can also use your preferred framework, or pure javascript/HTML5
- Page consist of 3 columns, first column has fixed width of 200px, last column has fixed width of 300px, the middle column expand/shrink to fill the remaining space of the page, and should be at least 100px. If window is smaller than 600px, show the scrollbar.
- In the first column, create an input field, where user can enter any number. If the value entered by users are not integer, round it to the nearest integer. If user enter negative values, replace it with 1.
- In the second column, show a drop down, which user can choose what calculation between "isPrime" and "isFibonacci" he wants to calculate, default the value to isPrime.
  - isPrime: calculate whether the input is a prime number, show true in Col3 if the number is prime, and false in the other case
  - IsFibanacci: calculate whether the input is a fibonacci number, show true in Col3 if the number is a fibonacci number, and false in the other case.
- Whenever the value in input box in column1, or the dropdown in column2 changes, execute the calculation accordingly, and show the result in column 3.

13	isPrime ⌄	true
200px	**Expand/Shrink to fill the available space**	**300px**

Answer : https://codesandbox.io/s/question-1-bkxbq

Question 2

Create a web app with an input for using as filter and a table for display the result. The app need to get data from https://api.publicapis.org/categories for using for displaying in the result table.

        Result table

- By default display all data from categories

        Filtering

- When user type any text in the input box, the result table should be filter to display only the result that contains the text.

NOTE

- The app could created with any framework but Angular is preferred

Question 3

Write a node.js code that retrieve NAV (Net Asset Value) of a Fund from this website
https://codequiz.azurewebsites.net/

The code should be in a single js file, and can be run using "node yourfile.js FUNDCODE" using
node 12. After running "node yourfile.js BEQSSF" we should get BEQSSF nav print out in the
console (11.247), similary running "node yourfile.js BM70SSF" should print out 9.9774 .

Code Quiz

Funds NAV

Fund Name	Nav	Bid	Offer	Change
B-INCOMESSF	10.0548	10.0549	10.0548	0.0107
BM70SSF	9.9774	9.9775	9.9774	0.0927
BEQSSF	11.247	11.2471	11.247	0.1319
B-FUTURESSF	11.443	11.4431	11.443	0.1488
